

## **Writeup for File Handling Project:**

### **Project Objective:**

Created a java project For File Handling to perform various operations on file like Write, Read and Append.

### **Approach Used:**

- File Handling plays a major role in doing so as the first essential step is writing content to a file.
- First approach used is FileWriter class to create a file in empty folder and write desired text in file
- Second approach used is FileReader class to read any text from file.
- For Append Operation I used FileWriter class to add some text to an existing file.
